

# WHAT FLOATS EXPERIMENT

## Supplies:

- Clear tub or bucket
- Toys or any natural objects from outside

## Instructions:

- 1.Fill a shallow tub 3/4 full of water.
- 2.Collect toys that are waterproof, or even pieces of nature that you can find.
- 3.Make a guess if each object will either float or sink and then test to see.

## Tips:

Collecting the toys can be part of the fun. Go on a hunt for the right ones. Most toys will float as they are meant to, ensure you get some objects that will sink, some ideas could be a rock or a spoon. Older children can make a chart based on their findings. They can make two columns for float and sink and they can draw the objects under the corresponding column.
